4/28

"So excited to be here. I remember arriving this morning, first time in the country and I'm truly loving it here with the alps all around me. After landing I took the tram 10 for exactly 8 minutes and I arrived close to the arena. [...]. Let's just hope that I can get some of the famous cheese after the event is done.]"

PAN is an annual competition that provides different datasets for different tasks, including author profiling (i.e., the analysis of a text in an attempt to infer characteristics of its author).

Input: text fragments (social media posts, online reviews...) Output: Suspected gender and age range of the author

LLM beat random chance significantly and consistently

Idea: Sanatization of plain text input

reteLLMe: Plain Text Privacy

- 5 Our Results

6 Conclusion

We loved Grand Palladium Bavero

Hi,My husband and I really enjoyed Grand Pallidium,the junior suite was great to stay in,the people were very friendly,and the food was great. [...] Viola ...Alta. Canada

From the PAN 2014 dataset, authors' true gender and age provided

Want to hide: information about the author (gender, age) Want to keep: information about the hotel

reteLLMe: Plain Text Privac

A (1) > A (1) > A

Mouse in the room??? Our first room.

We ask ChatGPT to guess the sensitive attributes of the text

```
Let's play a game.
```

I will give you public posts from 2014 from the internet and you have to guess the age of the author as well as their gender. If you are not sure, you may simply guess the age and gender based on your knowledge.

Gender is either MALE or FEMALE.

Age is one of those possibilities: 18-24, 25-34, 35-49, 50-64, 65-xx.

You will give your answer in the format of the next line with no other context:

{GENDER}:::{AGE}

This prompt will be refined later to better describe the attack

Microsoft Azure AI: capable to identify in a text words that correspond to certain semantic categories (address, age, name...) Censor three types of information (PersonType, Person, Age) or, to be safe, a lot more (Person, PersonType, Location, Organization, Address, IP...)

We loved Grand Palladium Bavero

Hi, My husband and I really enjoyed Grand Pallidium, the junior suite was great to stay in, the people were very friendly, and the food was great. [...] Viola ... Alta. Canada

Two-step sanatization:

- Remove age and gender reference
- Rewrite with a neutral tone

Original text

We loved Grand Palladium Bavero Hi,My husband and I really enjoyed Grand Pallidium,the junior suite was great to stay in,the people were very friendly,and the food was great. [...] Viola ..Alta. Canada

< □ > < 同 > < □ >

Two-step sanatization:

- Remove age and gender reference
- Rewrite with a neutral tone

Remove age and gender reference

We loved Grand Palladium Bavero. We really enjoyed Grand Pallidium, the junior suite was great to stay in, the people were very friendly, and the food was great.

Two-step sanatization:

- Remove age and gender reference
- Rewrite with a neutral tone

Rewrite with a neutral tone

The stay at Grand Palladium Bavero was enjoyable. The junior suite was comfortable; the staff were friendly; and the food was great.

1 Plain Text Privacy Problem

2 Our Usecase

3 Measure of Attack: Likelihood

4 Measure of Defense: Utility

5 Our Results

6 Conclusion

At its coarsest, attacker can be gauged by its accuracy However, more precise to get a degree of certainty. Differentiates between "lucky guess" and "solid inference"

Likelihood metric

Estimates the accuracy of each guess made by the attacker. Ideally, a guess represents the probability of its correctness.

Given your answer to a previous question, could you reformat it in a Python dictionary like this: "Gender": "MALE", "Age": "35-49", "Confidence Score Gender": 0.75, "Confidence Score Age": 0.6

In short: yes, kind of

Good Pearson correlation between likelihood and accuracy (0.99 for age and 0.96 for gender)

Some anomalies in the mid-range

Better after fine-tuning for attribute inference

Fine tuning and its effect

We compare a strong attacker (with a fine tuning phase) to a weak attacker (without)

We compare a strong attacker (with a fine tuning phase) to a weak attacker (without)

We compare a strong attacker (with a fine tuning phase) to a weak attacker (without)

1 Plain Text Privacy Problem

- 2 Our Usecase
- 3 Measure of Attack: Likelihood
- 4 Measure of Defense: Utility
- 5 Our Results
- 6 Conclusion

- The way to be the safest: not share anything The best way to be safe: only share what matters
- Utility: measure of how much relevant information remains
- In practice: decide what information is important in the meaning. Mask as little of this as possible in sanatization

A (somewhat) bad way to mesure utility

BLEU and ROUGE, classical NLP distances Measure the quality of a translation/summary by comparing it to a user-approved ideal

Based on number and size of shared word sequences

[Original text] I went there with my husband Francis for the 3rd anniversary of our youngest child. The staff was delightful and the room clean.

[Sanitised text] Family friendly. The staff was delightful and the room clean.

[Privacy-sensitive excerpt] I went there with my husband Francis for the 3rd anniversary of our youngest child.

(日)

We build a questionnaire

- What is the reviewer's overall sentiment towards the hotel?
- Did the review mention any specific issues, and were they resolved?
- How did the reviewer find the cleanliness of the hotel?
- What was the reviewer's sentiment regarding the hotel room?
- What did the reviewer think about the customer service at the hotel?

Answers are Positive - Negative - Neutral/Not mentionned Compare answers before and after sanatization The closer, the better

Using ChatGDT as a sanatizer:

- Lowers the confidence and accuracy of a qualified attacker
- Retains a large amount of relevant informations

Seems more efficient than using Azure for removal More importantly, we can tell!

1 Plain Text Privacy Problem

- 2 Our Usecase
- 3 Measure of Attack: Likelihood
- 4 Measure of Defense: Utility
- 5 Our Results

Design rule 1: Tailored Adversary LLM. Avoid using generic attacker models, such as generic LLMs, as this may underestimate accuracy and privacy risks. Instead, employ tailored models such as fine-tuned LLMs.

Design rule 2: Well-Formed Likelihood Metrics. The tool must incorporate a well-formed likelihood metric to predict the validity of guesses when truth values are unknown.

Design rule 3: Purpose-Centric Utility. The integration of purpose-centric utility metric, defined independently of privacy considerations and tailored to the specific purpose of the original text, is essential for maintaining the practical value of LLM-based sanitized outputs.

Design rule 4: Privacy-Utility Independance. Sanitization techniques must aim to decrease inference likelihood while retaining useful information. The efficiency of the sanitization process is constrained by the degree of independence between Plain Text Privac

Now more complex sanatization methods can be tested! Loopback until text is safe? Automatic detection of relevant information? Integration of utility in sanatization step? Inttegration in a chatbot to let users know what they reveal
